1.7 7. Architecture

The OwlTweet platform is structured around a simple event-driven design:

- Client layer: web dashboard for content creation, monitoring, and administration
- Application layer: authentication, scheduling, analytics aggregation, and posting logic
- Data layer: persistent storage for posts, media metadata, and platform activity
- Integration layer: outbound connectors for social platform APIs and notification services

The application separates content orchestration from analytics reporting, which allows the system to process scheduled posts reliably while preserving observability for operational teams.

1.8 8. Data and Security Considerations

- User credentials are stored using secure, hashed representations.
- API tokens are scoped to the minimum required permissions.
- Post metadata is retained for audit, analytics, and troubleshooting.
- Sensitive operational logs are restricted to authorized system administrators.

1.9 9. Known Limitations

- Publication latency may vary based on upstream platform availability.
- Repeated metric polling can be temporarily throttled by external APIs.
- Historical analytics are limited by retention settings.
- Content preview fidelity may differ between client browsers.

1.12 12. Risks and Dependencies
